Discover who you're trading with.

AI + Finance | Solution Track, Mirae Asset Securities Global AI Festival 2026

> Imagine having an engine that sifts through daily broker data using AI, pinpointing stocks where smart money is quietly accumulating. It checks the story and the financial health behind each company, so clients can understand exactly who is on the other side of their trades, whether they're investing in Indonesia, Hong Kong, Korea, or China.

1. Every Trade Leaves a Broker's Footprint, and Some Point to "Smart Money"

When you buy a stock, you don't buy it directly from the stock market. Instead, a broker such as Mirae finds someone who wants to sell. At the end of the day, the stock exchange lists what each broker bought or sold, but it never shows your name. Whether you're a young person buying just 5 lots or a big fund buying 50,000 lots, you both show up as numbers under your broker's code.

But not all trades mean the same thing. App-based brokers help millions of everyday people invest small amounts. On the other hand, foreign and institutional brokers work with big funds that have lots of resources and do deep research. Foreign investors actually own almost 37% of all shares in Indonesia. Studies show these big players often buy before good news comes out and sell before bad news hits. So, if you notice them quietly buying up a stock that nobody's talking about, they might know something. If they're selling and those shares end up with many small investors, it could signal they're moving on.

2. The Challenge: Public Data That's Difficult to Decipher

These footprints are public in four major Asian markets:

Market	Data Published	Frequency
Indonesia	Shares bought and sold by each broker	Daily, after the close
Hong Kong	Shares held by each broker and by mainland investors	Daily
Korea	Buying and selling by investor type and the top five brokers per stock	Daily
China	The top five broker branches buying and selling	On big price-move days

Every market tells its own story, but we can look at them all using the same simple approach. This works best for small and medium-sized companies. Even though stock information is available to everyone, making sense of it is a real challenge. To really understand one stock, you'd need to gather weeks of numbers and connect them to what's happening at the company. That's why most people just look at the price or follow the crowd, which often means they join too late.

3. The Missing Piece

It's easy to find out what a company is worth or what's happening to it. Knowing who is buying and selling it is still hard:

The question	How investors answer it today	What's missing
What is the company worth?	Reports, analyst notes, AI summaries	Well covered
What is happening to it?	News, filings, AI summaries	Well covered
Who is buying and selling?	Raw broker tables, a few tools like Stockbit's broker flow and IPOT X, influencers	Shown, but rarely explained

And just showing who is buying isn't enough. In January 2026, Chinese apps tagged a broker branch as a famous trader, and retail investors followed it in. Within days, that branch sold ¥817 million of one stock, and the price fell over 23%. Investors need to know who's on the other side, why they're there, and the day they start to leave.

4. Why Now?

Asia is experiencing a surge in new investors. The number of stockholders in Korea rose from about 6 million in 2019 to over 14.5 million in 2025. In China, 20 million new stock accounts were opened in the first nine months of 2025 alone, a 50% increase. Retail trading makes up about half of Indonesia's trading, while mainland investors account for roughly a quarter of Hong Kong's.

Investors want clear answers instead of digging through complex data. In eToro's 2025 survey of 11,000 investors across 13 countries, 19% used AI to pick or change investments, up from 13% the year before. A top reason: it saves time on research (42%, and 56% in Singapore).

Brokers are racing to add AI. By March 2026, Tiger Brokers' AI had passed 10 million interactions, with users up 148%. Futu and Indo Premier (IPOT X, which includes smart money tracking) launched new AI tools in 2026. The first broker to clearly explain the other side of every trade will set the market standard.

5. How Does The O-Side Work?

O-Side is an AI-powered feature that sits on top of an AI stock analyst. Every evening, it reads the broker data for every stock and links it to the two layers investors already have, because one signal alone can mislead:

- **The Story:** news and company moves, like a new owner, a buyout, or a rights issue. On its own, a story can be just hype.
- **Company Health:** is the business strong, or recovering? On its own, a healthy company can stay flat for years.
- **Transaction Analysis (the new layer):** who is really collecting the shares? Is it steady buying or a one-off trade that reverses tomorrow?

For every stock you own or watch, the O-Side card shows:

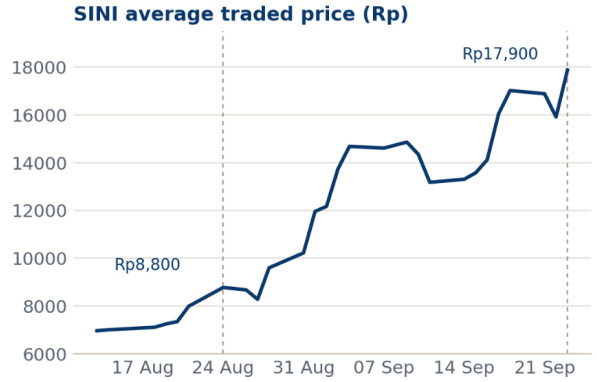

- Who is buying and selling, grouped into app brokers, foreign institutions, and mixed brokers, with a confidence score on each label.

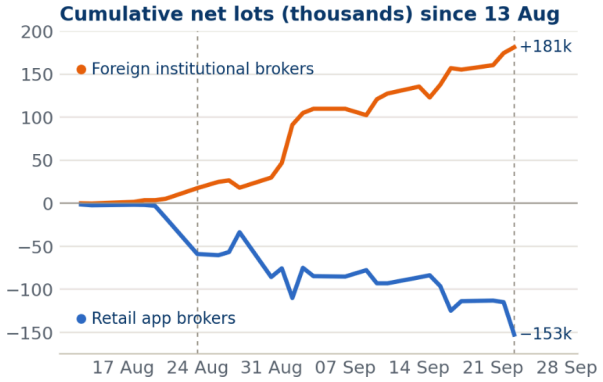

- Roughly what price each group paid, so you can see who's sitting on gains or losses.
- Whether that is changing, like big funds starting to sell to everyday investors.
- How it all connects to the story and company health, like buying that began right after a rights issue.

6. Real Example: SINI (PT Singaraja Putra), Indonesia

Here's how it works in real life. SINI was in trouble, sitting on the exchange's special monitoring board with negative equity of Rp687 billion. In June, it bought a coal miner (PT Kemilau Mulia Sakti) for Rp1.73 trillion, and in July it finished a Rp3.6 trillion rights issue at Rp5,000 per share. Its equity turned positive (about Rp3.5 trillion by 31 July), it left the monitoring board on 31 August, and the price jumped from about Rp7,000 to Rp17,900 in six weeks.

What did the broker data show? From 13 August to 23 September, app broker clients (mostly everyday investors) sold about 153,000 lots, with Stockbit clients selling at an average near Rp12,400. Foreign institutional brokers bought about 181,000 lots, more than half of it by 2 September, at an average near Rp10,800.

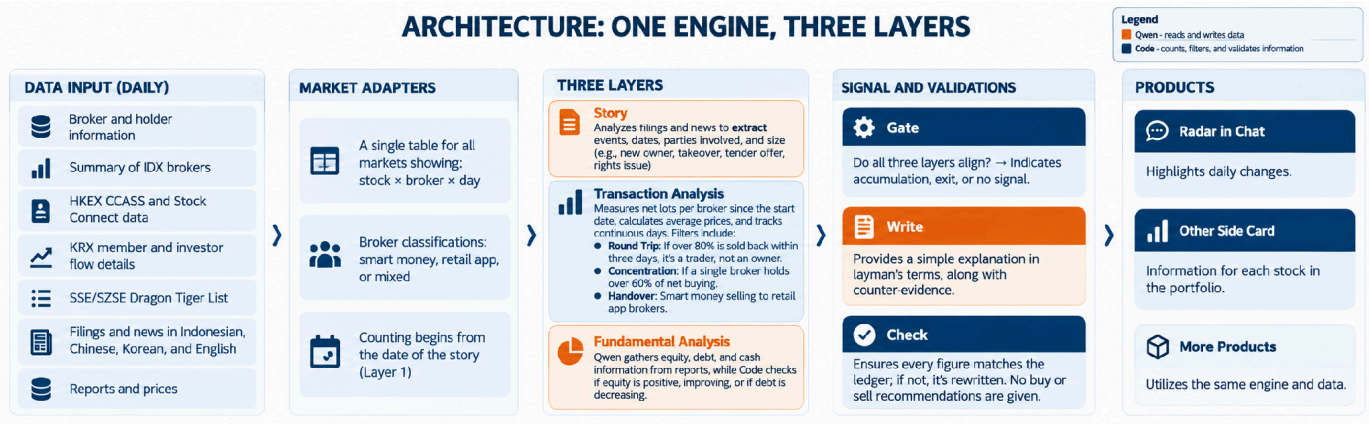

With O-Side, you would have seen:

- **24 August (about Rp8,800):** if you were selling, you'd see you were selling to foreign institutions, who had been buying for five days straight while retail was selling.
- **1 and 3 September:** broker ES sold 81,500 lots and didn't buy. That's often a big holder leaving; O-Side would tell you so, without guessing who.
- **23 September (about Rp17,900):** the risk had shifted. Institutions bought at around Rp10,800 to Rp13,300 and were up 35 to 65%. They could be the next sellers, so O-Side watches for the first day they start selling to retail.

How does the AI help? By hand, this took 30 screenshots, six weeks of notes, and matching them to filings. O-Side does it nightly:

- It reads filings and starts the count from the right date.
- It checks how reliable each broker label is: here, a broker many see as "smart money" was in fact the second-largest net seller.
- It filters out round trips, like Mandiri buying 17,500 lots on 17 September and selling 15,600 the next day.
- Qwen writes a clear summary in the client's own language, and code checks every number against the data.

Conclusion

Investors can already find out in seconds what a company is worth and what is happening to it. What they still can't easily see is who is positioned in the stock and whether those investors are arriving or leaving, even though exchanges across Asia publish that information every evening. O-Side reads it for every stock, places it next to the story and the fundamentals, and explains it in plain language without telling anyone what to do.

Every share you buy is sold to you by someone.

O-Side shows you what kind of investor that is and whether they are coming or going.
